

Lecture 27

Yao Li

Department of Statistics and Operations Research
UNC Chapel Hill

### Introduction

- Instructions
  - Download Tutorial 13 Zip
  - Unzip Folder
  - Required Packages
    - library(modelr)
    - library(tidyverse)
    - library(purrr)
    - library(broom)
  - Open .Rmd File and Knit

#### Discussion

- Problems With Current Approach
  - Same Model For All Locations
  - Not All Locations Used in Train
  - Not All Locations Used in Test
  - Residuals Indicate that Model Can Be Improved
  - Not Helpful for Forecasting
  - Ambiguous Results: No Clear Winner

- Previously
  - Split Data in Train and Test
    - Train (28 Rivers)
    - Test (3 Rivers)
  - Purpose
    - Estimate Out-of-Sample Error
    - Pick Best Model Based on This Estimate
    - Combat Overfitting
    - Robustification
  - Goal: Find the Simplest Model that Adequately Predicts

- Current Issues
  - Decision on Final Model Heavily Influenced by the Test Data
  - Loss of Data in Model Fitting
  - Not Appropriate in Small Datasets
- Cross Validation Idea
  - Split Data Into Many Groups
  - Each Group Acts as a Test Set
  - All Data is Used in Both Model Fitting and Model Testing
  - Help: Chapter 5 (ISLR)

- Tidyverse Concepts
  - Chapter 20 (R4DS)
  - List-Columns
    - Columns in Data Frames or Tibbles Can Be Lists
    - What this Means
      - Column of Tables
      - Column of Models
      - Column of Functions
  - Functions
    - nest(): Converts Rows of a Data Frame into a List
    - unnest(): What do You Think It Does?

- Run Chunk 1
  - Observe the Output
  - Column of Tibbles
- Run Chunk 2
  - Imagine We Wanted to Split
    - Test: Data For Location 103
    - Train: All Remaining Data
  - Use of filter() and unnest()
  - First Glimpse -> 365 x 8
  - Second Glimpse -> 10,972 x 8

#### Chunk 3

- Run Each Line
- What is Happening?
- Use View() on DATA2 and Scan Through the Data
- What do You Notice?

#### Chunk 4

- Create a Loop that Repeats this Process for Each Location
- Each Location Is a Test Set
- Predictions Saved are All Out-of-Sample
- Run Chunk 4 to Test Your Code

Chunk 4 (Continued)

```
DATA2=DATA
DATA2$linpred=NA
for(k in unique(DATA2$L)){
 TEST = NEST.DATA %>% filter(L==k) %>%
unnest()
 TRAIN = NEST.DATA %>% filter(L!=k) %>%
unnest()
 linmod=lm(W~A, data=TRAIN)
 linmodpred=predict(linmod,newdata=TEST)
 DATA2$linpred[which(DATA2$L==k)]=linmodpred
```

- Chunk 5
  - In Our Data, We Have:
    - Actual Water Temperatures
    - Out-of-Sample Predicted Water Temperatures
  - Create RMSE.func() With Two Arguments
    - actual= vector of actual water temperatures
    - predict=vector of predicted water temperatures
  - Use This Function on the Two Columns in DATA2 for RMSE
    - actual=W
    - predict=linpred

Chunk 5 (Continued)

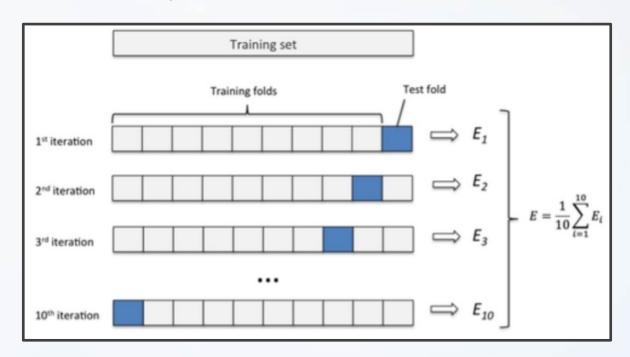

```
RMSE.func(actual=DATA2$W,predict=DATA2$linpred)
L] 3.147084
```

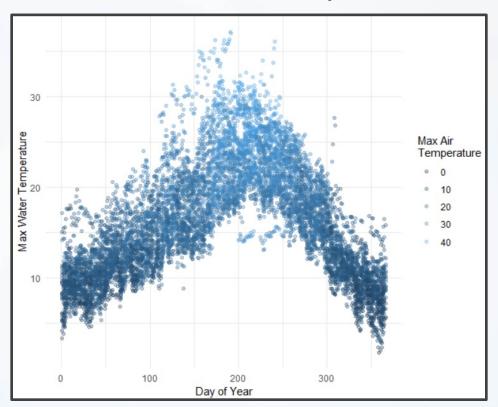

#### Intermission

- Current
  - Using the Natural Grouping of Data for 31-Fold Cross Validation
  - Only Fit One Linear Model
  - Should Use Cross-Validation for Multiple Different Models and Compare Cross-Validated RMSE
- Next
  - Randomly Assign Observations to K-Folds
  - CV Function: crossv\_kfold(K)

- Overview (*K*=10)
  - Randomly Split Observations Into K Groups
  - Each Fold Acts as a Test Set
  - If Each Fold Contains Approximately the Same # of Observations,

- Run Chunk 1
  - Variables (Julian Day)
  - Clear Non-Linear Relationship

General Polynomial Model

$$W = a + \sum_{i=1}^{I} b_i A^i + \sum_{j=1}^{J} c_j D^j + \varepsilon$$

- Perform K-Fold CV to Estimate Out-of-Sample RMSE for Choices of *I=4* and *J=3*
- Ultimate Goal is To Select Best I and J

- Run Chunk 2
  - Fit Model with *I=4* and *J=3*
  - Functions from broom Package
    - tidy()
    - glance()
  - Used to Preview Models

```
tidy(polymodel)

```

- Run Chunk 3
  - Divide Data into 10 Folds
    - Use crossv\_kfold() Function
    - Variables are Lists of Train and Test Sets
  - For Each Row, We Want to Fit on Train and Predict on Test

- Run Chunk 4
  - Create Function to Fit Models
  - Apply Function to All Train Sets Using purrr::map()
     Function

```
DATA4=DATA3 %>%
     mutate(tr.model=map(train,train.model.func,i=i,j=j))
head(DATA4)
A tibble: 6 x 4
                      .id
train
         test
                             tr.model
        <1ist>
                      <S3: resample> <S3: resample> 01 <S3: lm>
<S3: resample> <S3: resample> 03 <S3: lm>
<S3: resample> <S3: resample> 04 <S3: lm>

<S3: resample> <S3: resample> 06
                             <S3: 1m>
```

- Functions from purrr Package
  - map() Loop Over Train
  - map2() Loop Over Fitted Models and Test

- Run Chunk 5
  - purrr::map2() Iterates Function Over Two Arguments
  - For Every Test Set and Trained Model, We Use

augment() to Get Predictions

```
DATA4.PREDICT = DATA4 %>%
          mutate(predict=map2(test,tr.model,~augment(.y,newdata=.x))) %>%
          select(predict) %>%
          unnest()
head(DATA4.PREDICT)
A tibble: 6 x 10

                                                               0.0621
                   103 10.7
                                       50
        50 2003
                              14
                                                        11.5
                                                               0.0548
```

Next, Compare Actual With Fitted Using RMSE.func()

```
RMSE.func(actual=DATA4.PREDICT$W,predict=DATA4.PREDICT$.fitted)

19
```

### **Look Ahead**

- What We Have Done
  - Specify I and J
  - Use 10-Fold Cross Validation to Estimate Out-of-Sample RMSE
- How We Should Use This
  - Choose Max I and Max J (Example: 10)
  - Initiate 10 x 10 Matrix of NA
  - Loop Through All i and j to Capture Out-of-Sample RMSE
  - Create a Tile Plot that Visualizes the RMSE for Each Combination of i and j
  - Choose Best i and j
